Introduction

This manual provides the technical information necessary for servicing the **VXR-9000** Rack Mount Repeater.

Servicing this equipment requires expertise in handling surface-mount chip components. Attempts by non-qualified persons to service this equipment may result in permanent damage not covered by the warranty, and may be illegal in some countries.

Two PCB layout diagrams are provided for each double-sided board in this transceiver. Each side of the board is referred to by the type of the majority of components installed on that side ("Side A" or "Side B"). In most cases one side has only chip components (surface-mount devices), and the other has either a mixture of both chip and leaded components (trimmers, coils, electrolytic capacitors, ICs, etc.), or leaded components only.

As described in the pages to follow, the advanced microprocessor design of the **VXR-9000** allows a complete alignment of this transceiver to be performed without opening the case of the radio; all adjustments can be performed from the personal computer, using with the Vertex Standard VPL-1 Programming Cable and CE60 Software.

While we believe the information in this manual to be correct, Vertex Standard assumes no liability for damage that may occur as a result of typographical or other errors that may be present. Your cooperation in pointing out any inconsistencies in the technical information would be appreciated.

Important Note

After Lot. 30 of this transceiver was assembled using Pb (lead) free solder, based on the RoHS specification.

Only lead-free solder (Alloy Composition: Sn-3.0Ag-0.5Cu) should be used for repairs performed on this apparatus. The solder stated above utilizes the alloy composition required for compliance with the lead-free specification, and any solder with the above alloy composition may be used.

DSUB 25-pin Accessory Connector

The **VXR-9000** repeater is provided with a 25-pin DB-25F female connector for interconnections to accessories. Use a DB-25M 25-pin male connector to connect accessories to the repeater. The pins on the accessory connector are explained in detail as follows:

DB-25 PIN NUMBERING

Pin 1: GND

Chassis ground for all logic levels and power supply return.

Pin 2: +13.6 V

[POWER SUPPLY]

This pin provides 13.6 Volts, 2.0 A, DC from the repeater supply. There is a internal 3 A fuse to prevent damage to the repeater.

Pin 3: TX AF IN

[ANALOG TRANSMITTER INPUT] (VOICE BAND: 300 ~ 3,000 Hz)

This pin is a audio input. Input impedance is 600 Ohms. This audio is injected before the splatter filter stage, so excess signal input levels are clipped.

Use shielded cable to connect to this pin, and connect the shield to GND.

Pin 4: TONE IN

[TRANSMITTER INPUT] (SUB-AUDIBLE BAND: 5 ~ 250 Hz)

This pin is sub-audible tone produces 10% of full system deviation. The nominal input voltage is 77.5 mVrms. The input impedance is 600 Ohms, and has a flat response characteristic (repeater deviation is constant for a given signal level over the frequency range of 5 ~ 250 Hz). Injecting too high a voltage here causes over-deviation of CTCSS or DCS, degrading performance. Use shielded cable to connect to this pin, connecting the shield to GND.

Pin 5: TX ATT

This output is intended for controlling an external coaxial switching relay. It is an open drain output which can sink approx. 1.5 A when active. The delay time which is between the repeater cause to transmit mode and this port switches to ground can be programmed by your VERTEX STANDARD dealer.

Pin 6: DISC OUT

[ANALOG OUTPUT] (WIDE-BAND: 0 ~ 3,000 Hz)

Received signals with full system deviation produce 350 mVrms audio at this pin. The output impedance is 600 Ohm, and is extracted before the de-emphasis and squelch circuitry. Use shielded cable to connect to this pin, and connect the shield to GND.

Pin 7: N.C.

No connection.

Pin 8: RSSI

[ANALOG OUTPUT]

A DC voltage proportional to the strength of the signal currently being received (Receiver Signal Strength Indicator) is provided on this pin. This low impedance output is generated by the receiver IF sub-system and buffered by an internal op-amp. Typical voltages are graphed as follows:

Pin 9: COAX. SW

[LOGIC OUTPUT (ACTIVE LOW)]

This output is intended for controlling an external coaxial switching relay. It is an open drain output which can sink approx. 1.5 A when active. This signal only switches if the repeater has been programmed for "SIMPLEX" mode. If programmed for "DUPLEX," the signal remains open (high impedance) at all time.

DSUB 25-pin Accessory Connector

Pin 10, 13, 15, 16, 17, 18, 19, 21:

PROGRAMMABLE I/O "0" ~ "7"

The **VXR-9000** provides eight ports (PIO) that can be programmed for various input or output signals, or for control functions. Each port may be programmed as to its function, its status (input or output), and its logic (for output ports only). See Tables on the next page for detail regarding the input and output signals.

Pin 11: NSQ DET

This is an open-collector, active-low output capable of sinking about 10 mA. It indicates that the receiver squelch is open. If the squelch control is properly set, this indicates a carrier on the receiver channel.

Pin 12: EXT PTT

This input is internally pulled up to 5 VDC. When pulled low by an external device, it keys the repeater transmitter while the repeater is operating in the "Remote" mode. Avoid voltage in excess of 5 V on this pin, or internal damage to the microprocessor on the repeater CNTL Unit may result.

Pin 14, 20: GND

Chassis ground for all logic levels and power supply return.

Pin 22: RXD LOW

[ANALOG OUTPUT FOR DATA COMMUNICATIONS]

(300 ~ 3,000 Hz)

This pin is an output for low speed receiving data signals (typically 1200 bps), with the data being extracted after the de-emphasis and low pass filter stages.

Pin 23: RXD HIGH

[DIGITAL OUTPUT FOR DATA COMMUNICATIONS]

(Max.: 5 kHz)

This pin is an output for high speed receiving data signals (typically 9600 bps), with the data being extracted immediately after the discriminator (prior to any de-emphasis).

Pin 24: TXD LOW

[ANALOG INPUT FOR DATA COMMUNICATIONS]

(300 ~ 3,000 Hz)

This pin is intended to be used as a low speed data signal input to the repeater (typically 1200 bps). This digital data signal is injected before the transmitter pre-emphasis and limiting stages, so excess signal input levels are clipped.

Pin 25: TXD HIGH

[DIGITAL INPUT FOR THE DATA COMMUNICATIONS]

(0 ~ 5 kHz)

This pin is intended to be used as a high speed digital data signal input to the repeater (typically 9600 bps). This digital data signal is injected after the transmitter splatter filter stage.

Circuit Description

RECEIVE SIGNAL PATH

Incoming RF from the RX antenna jack is delivered to the MAIN Unit and passes through the protection diode **D1001 (1SS302)** and a varactor-tuned band pass filter consisting of coils L1003 and L1004, capacitors C1015, C1018, C1021, C1032, and C1044, and diodes **D1003** and **D1004** (both **HVU350**). Signals are then applied to the RF amplifier, **Q1009 (2SC3357)**. The amplified RF signal is applied through a varactor-tuned band pass filter consisting of coils L1010 and L1011, capacitors C1079, C1092, C1082, C1095 and C1075, and diodes **D1007** and **D1005** (both **HVU350**) to the first mixer **Q1018 (SPM5001)** along with the first local signal from the PLL circuit.

The first local signal is generated between 376.65 MHz and 416.65 MHz by the RX VCO, which consists of FET **Q1048 (2SK508)** and varactor diodes **D1018** and **D1019** (both **1SV282**) or FET **Q1049 (2SK508)** and varactor diodes **D1020** and **D1021** (both **1SV282**), according to the programmed receiving frequency; the local signal then passes through buffer amplifier **Q1059 (2SC5226)** and first local amplifier **Q1019 (2SC3357)** to the first mixer **Q1018 (SPM5001)**.

The 73.35 MHz first IF signal is applied to monolithic crystal filters **XF1001** and **XF1002** which strip away unwanted mixer products, and the IF signal is applied to the first IF amplifiers **Q1022 (2SC5226)**. The amplified first IF signal is then delivered to the FM IF subsystem IC **Q1028 (TA31136FN)**, which contains the second mixer, second local oscillator, limiter amplifier, noise amplifier, and FM detector.

The second local oscillator signal, generated by the 72.895 MHz crystal **X1002**, produces the 455 kHz second IF signal when mixed with the first IF signal within **Q1028 (TA31136FN)**. The second IF signal passes through ceramic filter **CF1001** or **CF1002** which strips away all but the desired signal, and then passes through the limiter amplifier within **Q1028 (TA31136FN)** to ceramic discriminator **CD1001**, which removes any amplitude variations in the 455 kHz IF signal before detection of speech. The detected audio passes through the low pass filter, consisting of **R1199** and **C1244**, which rejects the 455 kHz IF component.

The audio signal from the MAIN Unit is delivered to the CNTL Unit and passes through the audio amplifier **Q1020 (NJM2904V)** to the active high pass filter section of **Q3020 (FX805LG)**, which rejects the sub-audible frequency component. The filtered audio signal is delivered to electronic volume **Q1056**, which adjusts the audio sensitivity to compensate for audio level variations, then passes through audio amplifier **Q1020 (NJM2904V)**, audio switch **Q1040 (BU4066BCFV)**, attenuator consisting of **R1233**, and limiter amplifier **Q1050 (NJM2904V)**, to the electronic vol-

ume control **Q1056 (M51132FP)**, where the maximum deviation is set. The audio signal subsequently passes through the 3-section active low pass filter consisting of **Q1017-1/-2/-3 (NJM2902V)** and audio amplifier **Q1001 (NJM2902V)** to providing the repeater transmit audio.

A portion of the audio signal from the active high pass filter section of **Q4024 (NJM2902V)** is de-emphasized consisting of **Q3036 (TA75S01F)**, **R3198**, and **C3144**, providing a flat audio response. The filtered audio then passes through the active band pass filter **Q3021 (NJM2902V)** and audio mute gate **Q3015 (DTC323TK)** to audio power amplifier **Q1057 (TDA2003)**, providing up to 2 Watts of audio power to the 8 Ohm loudspeaker.

SUB-AUDIBLE SIGNALING (DECODER)

A portion of the audio signal from the audio amplifier **Q1020 (NJM2904V)** passes through the 3-section active low pass filter **Q1025 (NJM2902V)** and the low pass filtering section of **Q3020 (FX805LG)** to separate the CTCSS tones from the received audio signal. The CTCSS tones are sent to the CTCSS decoder section of **Q3020 (FX805LG)**. When a CTCSS tone is received, the CTCSS information is delivered to pin 77 of the Main CPU **Q3014 (HD64F2238)** from pin 4 and 8 of **Q3020 (FX805LG)** which compares the CTCSS tone with the programmed tone.

Another portion of the audio signal passes through the 3-section active low pass filter **Q3044 (NJM2902V)** to separate the DCS codes from the received audio signal. The low pass filtered signal passes through the phase detector **Q3044 (NJM2902V)** to pin 39 of the Main CPU **Q3014 (HD64F2238)**. When a DCS code is received, the Main CPU **Q3014 (HD64F2238)** compares the DCS code with the programmed code.

If the received CTCSS tone or DCS code matches the programmed tone or code, pin 4 of the Main CPU **Q3014 (HD64F2238)** goes low, turning off the squelch switch **Q3015 (DTC323TK)** and passing the received audio signal to the audio power amplifier **Q1057 (TDA2003V)**.

SQUELCH CONTROL

The squelch circuit consists of noise amplifier **Q1033 (2SC4116GR)** and noise detector **D1015 (MA143)** on the MAIN Unit, and control circuitry within Main CPU **Q3014 (HD64F2238)** on the CNTL Unit.

When no carrier is received, noise at the output of the audio detector stage of **Q1028 (TA31136FN)** is amplified by **Q1033 (2SC4116GR)**, and then rectified by **D1015 (MA143)** to provide a DC control voltage for the squelch switch. The resulting DC voltage is delivered to pin 23 of **J1005**.

The DC voltage from the MAIN Unit is delivered to the A-D analog input port (pin 51) of the Main CPU **Q3014**

Circuit Description

(**HD64F2238**) on the CNTL Unit, which compares the squelch threshold level to that which is memorized in EEPROM **Q3006 (BR24L32F)** or set by the front panel SQL control.

RX PLL AND VCO CIRCUITS

The receiver's PLL circuitry consists of PLL subsystem IC **Q1052 (MB15A02PFV1)** on the MAIN Unit, which contains a reference oscillator/divider, serial-to-parallel data latch, programmable divider, phase comparator and a swallow counter. Stability is obtained by a regulated 5 VDC supply via **Q1062 (L78M05T)** and temperature compensated 14.4 MHz crystal oscillator **X1003**.

The RX VCO made up two VCO circuit, one is Low-Band RX VCO, consisting of FET **Q1048 (2SK508)** and varactor diodes **D1018** and **D1019** (both **1SV282**), and another one is High-Band RX VCO, consisting of FET **Q1049 (2SK508)** and varactor diodes **D1020** and **D1021** (both **1SV282**), oscillates between 376.65 MHz and 416.65 MHz according to the programmed receiving frequency. The RX VCO output passes through buffer amplifier **Q1059 (2SC5226)** and first local amplifier **Q1019 (2SC3357)** to the first mixer **Q1018 (SPM5001)**, as described previously. A portion of the RX VCO output is applied to the prescaler/swallow counter section in the PLL IC **Q1052 (MB15A02PFV1)**. There the RX VCO signal is divided by 64 or 65, according to a control signal from the Main CPU **Q3014 (HD64F2238)** on the CNTL Unit, before being applied to the programmable divider section of the PLL IC **Q1052 (MB15A02PFV1)**.

The data latch section of the PLL IC **Q1052 (MB15A02PFV1)** also receives serial dividing data from the Main CPU **Q3014 (HD64F2238)**, which causes the pre-divided RX VCO signal to be further divided by 75,330 ~ 81,330 (or 60,264 ~ 65,064) in the programmable divider section in the PLL IC **Q1052 (MB15A02PFV1)**, depending upon the desired receive frequency, so as to produce a 5 kHz (or 6.25 kHz) derivative of the current RX VCO frequency. Meanwhile, the reference divider section of the PLL IC **Q1052 (MB15A02PFV1)** divides the 14.4 MHz crystal reference from the reference oscillator **X1003** and **Q1045 (2SC4116GR)** by 2880 (or 2304) to produce the 5 kHz (or 6.25 kHz) loop reference.

The 5 kHz or 6.25 kHz signal from the programmable divider (derived from the RX VCO) and that derived from the crystal are applied to the phase detector section of the PLL IC **Q1052 (MB15A02PFV1)**, which produces a pulsed output with pulse duration depending on the phase difference between the input signals. This pulse train is then converted to DC, low pass filtered, then fed back to the RX VCO varactor diodes **D1018/D1019** and **D1020/D1021** (all **1SV282**).

Changes in the DC voltage applied to the varactor diodes **D1018/D1019** and **D1020/D1021** (all **1SV282**) affect the reactance in the tank circuit RX VCO **Q1048/1049** (both **2SK508**), changing the oscillating frequency according to the phase difference between the signals derived from the RX VCO and the crystal reference oscillator. The RX VCO is thus phase-locked to the reference frequency standard.

TRANSMIT SIGNAL PATH

The speech audio from the CNTL Unit is applied to the varactor diode **D1010 (HVU350)**, which frequency modulates the TX VCO from the unmodulated carrier at the transmit frequency. The modulated transmit signal is buffered by **Q1026 (2SC5226)**, then passes through the RF amplifier **Q1030 (2SC3357)** and RF diode switch **D1016 (RN739F)** to the PA Unit.

The transmit signal is applied to the RF amplifier **Q5001 (2SC3357)** and **Q5008 (PD55008)**, then finally amplified by power amplifier **Q5015** and **Q5016** (both **PD55025S**) up to 50 Watts. Harmonic and spurious radiation in the final output is suppressed by a low pass filter consisting of coils **L5007 ~ L5010**, plus capacitors **C5071, C5078, C5082, C5085, and C5088** on the PA Unit, before delivery to the TX antenna jack.

TX PLL AND VCO CIRCUITS

The Transmitter's PLL circuitry consists of PLL subsystem IC **Q1008 (MB15A02PFV1)** on the MAIN Unit, which contains a reference oscillator/divider, serial-to-parallel data latch, programmable divider, phase comparator and a swallow counter. Stability is obtained by a regulated 5 VDC supply via **Q1062 (L78M05T)** and temperature compensated 14.4 MHz crystal oscillator **X1001**.

The TX VCO, consisting of FET **Q1021 (2SK508)** and varactor diodes **D1008** and **D1009** (both **1SV282**), oscillates between 450 MHz and 490 MHz according to the programmed transmit frequency. The theory of operation of the remainder of the PLL circuitry is similar to that of the RX PLL circuit; however, dividing data from the Main CPU **Q3014 (HD64F2238)** on the CNTL Unit is such that the VCO frequency is the actual transmit frequency.

APC (AUTOMATIC POWER CONTROL)

RF power output from the final amplifier **Q5015/Q5016** (both **PD55025S**) is sampled by **C5061/C5056** and is then rectified by **D5007** and **D5008** (both **HSM88AS**). The resulting DC voltage is applied to the comparator **Q5005 (TA75S01F)**, where the voltage is compared with a reference voltage from the Main CPU **Q3014 (HD64F2238)** on the CNTL Unit, to produce a control voltage for the Automatic Power Controller **Q5004 (2SC4116GR)** and

Q5002 (2SB1122S), which regulates supply voltage to **Q5001 (2SC3357)**.

CNTL (CONTROL) UNIT

The CNTL Unit consists of 8-bit CPU **Q3014 (HD64F2238)**, EEPROM **Q3006 (BR24L32F)**, RX and TX speech audio circuits, and various analog switches for the CPU and repeater interconnections.

Microprocessor operational code is stored in **Q3006 (BR24L32F)**, while channel data and repeater configuration information is programmed from an external PC connected to the front panel's **MIC** jack via a VPL-1 programming cable.

The output from the Main CPU **Q3014 (HD64F2238)** contains serial control data used for REPEATER/BASE mode control, as well as TX and RX PLL data. Crystal **X3002** oscillates at 12.288 MHz, and provides stable clock timing for the Main CPU. When the repeater is powered on, the voltage at pin 62 of **Q3014 (HD64F2238)** becomes stable, and the output of voltage detector IC **Q3012 (BD4845FVE)**, which is tied to pin 59 (RST) of **Q3014 (HD64F2238)** becomes high, resetting the Main CPU.

BASE OPERATION (TX, MIC-INPUT AUDIO)

Microphone input is delivered past the MIC MUTE switch **Q4002 (DTC323TK)**, then passes through the audio amplifier and active high pass filter at **Q4001 (NJM2902V)** when the signal is processed in the same manner as previously described.

Circuit Description

Note:

Introduction

The VXR-9000 has been aligned at the factory for the specified performance across the entire frequency range specified. Realignment should therefore not be necessary except in the event of a component failure. All component replacement and service should be performed only by an authorized Vertex Standard representative, or the warranty policy may be voided.

The following procedures cover the sometimes critical and tedious adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts are replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; realignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed only by authorized Vertex Standard service technicians who are experienced with the circuitry and fully equipped for repair and alignment. Therefore, if a fault is suspected, contact the dealer from whom the transceiver was purchased for instructions regarding repair. Authorized Vertex Standard service technicians realign all circuits and make complete performance checks to ensure compliance with factory specifications after replacing any faulty components. Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Vertex Standard must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners. Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary. The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Correction of problems caused by misalignment resulting from use of improper test equipment is not covered under the warranty policy. While most steps do not require all of the equipment listed, the interactions of some adjustments may require that more complex adjustments be performed afterwards. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Have all test equipment ready before beginning, and follow all of the steps in a section in the order presented.

Alignment Preparation & Precautions

A 50-ohm RF Dummy load and in-line wattmeter must be connected to the main antenna jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 20 °C and 30 °C (68 °F ~ 86 °F). When the transceiver is brought into the shop from hot or cold air, it should be allowed time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

Note: Signal levels in dB referred to in this procedure are based on 0 dB μ EMF = 1.0 μ V.
